HOW TO USE JIFFY SPLICE TO MAKE SECURE CONNECTIONS

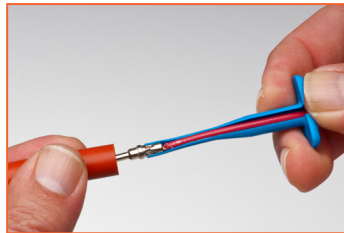

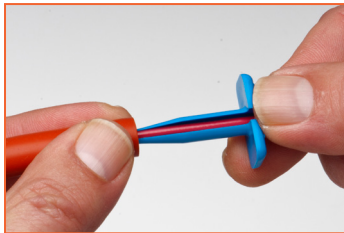

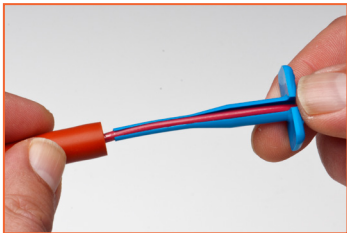

The Jiffy Splice connector uses the Deutsch Common Contact system and positive locking engineering to provide an easy, weatherproof and accessible inline splice protected by a silicone elastomer sleeve.

Just follow these easy instructions:

- 1 - Crimp the appropriate size pin and socket on the wires to be joined in the Jiffy Splice connector.
- 2 - Insert one end into the Jiffy Splice until it snaps into place. A slight tug will confirm that it is seated correctly.
- 3 - Insert the other wire into the other end until it locks.

- 1 - Select the correct size extraction tool and snap it around the wire to be removed.
- 2 - Slide the tool along the wire until it engages the contact and resistance is felt.
- 3 - Grasp the wire and extraction tool and gently pull both straight out of the Jiffy Splice connector.
